

# Information photonics technologies over time, space and frequency domains

Hirotsugu Yamamoto<sup>1,2,3,4,5</sup>

- <sup>1</sup>Dept. of Optical Eng., Graduate School of Eng., Utsunomiya Univ.
- <sup>2</sup>Center for Optical Research and Education, Utsunomiya Univ.
- <sup>3</sup>Institute of Technology and Science, Tokushima Univ.
- <sup>4</sup>ERATO (Exploratory Research for Advanced Technology), JST
- <sup>5</sup>CREST (Core Research for Evolutional Science and Technology), JST

## Hirotsugu Yamamoto

- 04/2015 – Present: Dept. of Optical Engineering, Graduate School of Engineering, Utsunomiya Univ.
- 06/2014 – Present: Institute of Science and Tech. Tokushima Univ. & ERATO Minoshima Project
- 04/2014 – Present: Center for Optical Research and Education, Utsunomiya Univ.
- 01/2013 – Present: Leader in the group of Information Photonics, Optical Society of Japan  
CREST Ishikawa Project.
- 10/2009 – Present: CREST Ishikawa Project.
- 04/1996 – 03/2014: Dept. of Optical Science and Tech., Tokushima Univ.
- 04/1994 – 03/1996: Graduate School of Eng., Univ. of Tokyo
- 04/1990 – 03/1994: Dept. of Mathematical Engineering and Information Physics, Univ. of Tokyo
- 04/1987 – 03/1990: Chiben Wakayama High School

Dr. Yamamoto received Young Scientist Award for the Presentation of an Excellent Paper, The Japan Society of Applied Physics, Outstanding Poster Paper Award at IDW'03, IDW'04, IDW'07, IDW'08, IDW'09, IDW'10, IDW'11, IDW'AD'12, IDW'13, IDW'14, and IMID2014, Best Paper Award at DHIP2011, IDW'11, and IWH2014, Best 3D Demonstration Award at SPIE/IS&T Electronic Imaging 2012, Excellent Poster Award at IEEE GCCE 2013, and the Gen-Nai Grand Prize from the Ozaki Foundation of Japan.

## Information Photonics

### Background

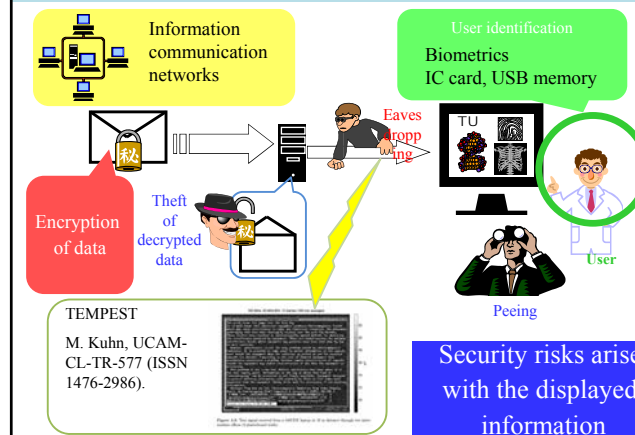

1. Optical Information Processing
  - A) Fourier optics
  - B) Holographic optical elements and information processing
  - C) Optical logics
2. Optical Computing
3. Optics in Computing
  - A) Optical interconnection
  - B) Optical data storage
  - C) Photonic networking

### Current trends

1. Information displays including, secure display, 3D display, and aerial display
2. Compressive sensing
3. Optical measurements and processing by utilizing optical information processing techniques
4. Nature-inspired computing such as DNA computing and nano-field processing
5. Digital holographic microscope
6. Information systems incorporating with human vision
7. Novel (and enjoyable) demonstrations by use of light as an information carrier

Mainly Inf.

## 1. Security risks on information display

### Secure display by use of visual cryptography

Displayed image

Encrypted displayed image

Decoding mask

Limited viewing zone

### Visual cryptography by use of polarization

P<sub>1</sub> R<sub>1</sub>R<sub>2</sub> R<sub>2</sub>R<sub>1</sub> P<sub>2</sub> Bright

P<sub>1</sub> R<sub>1</sub>R<sub>2</sub> R<sub>1</sub>R<sub>2</sub> P<sub>2</sub> Dark

P<sub>1</sub> R<sub>1</sub>R<sub>2</sub> R<sub>1</sub>R<sub>2</sub> P<sub>2</sub> Bright

P<sub>1</sub> R<sub>1</sub>R<sub>2</sub> R<sub>2</sub>R<sub>1</sub> P<sub>2</sub> Dark

Single encrypted film is composed of two quarter-wave retarders and perform as a half-wave retarder or a normal film, depending on the directions of the retarder films.

Decoded results depend on the combination of retarder films.

### Examples of polarization encryption

Overlaid result

$\theta_{21}=45^\circ \theta_{22}=30^\circ \theta_{23}=45^\circ \theta_{24}=90^\circ$   $\theta_{11}=0^\circ \theta_{12}=60^\circ \theta_{13}=90^\circ \theta_{14}=30^\circ$  Transmitted light intensity

1/4	1/2
1/2	1

Overlaid results depend on the stacking order.

### Multiple encryptions with stacking order

#### Experimental results

The diagram illustrates three different stacking orders for three masks (Mask 1, Mask 2, Mask 3). Each order shows the masks being stacked and the resulting encrypted image. Mask 1 is a dark pattern, Mask 2 is a light pattern, and Mask 3 is a complex pattern.

- Mask 1:** Mask 1, Mask 2, Mask 3
- Mask 2:** Mask 3, Mask 2, Mask 1
- Mask 3:** Mask 3, Mask 1, Mask 2

### Limitation of viewing angle

The images show the effect of viewing angle on a polarized encryption display. The top row shows a decoding mask (Special Xpol, 0.808mm pitch) and a displayed image (LCD, 0.882mm pitch). The middle row shows the display from different angles, with the text "Polarization Encryption 320x240" visible. The bottom row shows the display with a decoding mask and a wavelength dependence plot.

Viewing position: 10cm, 1.2m

Wavelength dependence

### Visual cryptography for secure display

**Visual cryptography**  
Visual secret sharing scheme was originally proposed by Naor & Shamir in 1994.

**Control of viewing zone**

- 3D display
- Parallax barrier
- Lenticular sheet
- Integral photography
- Holography
- And other 3D-ray-generating methods.

**Decoding without calculation**

Optical processing based on area coding

- Optical logic array processor by J. Tanida & Y. Ichioka (1983)
- Optical space-variant logic-gate array by T. Yatagai (1986)
- Polarization encryption by S. Fukushima & T. Kurokawa (1991)

The diagram illustrates a secure display system. A computer sends data to a CPU, which outputs to a display. A user is shown viewing the display. Threats like "Tapping" and "Spying data" are shown with red X marks. A "User" is shown with a "Peeping" icon crossed out. A "Decoding mask" is shown being applied to the display.

### Motivation: to draw attention of crowd to the digital signage

- Use of LED for digital signage is increasing.
- Audience measurement for digital signage is being conducted.  
> How many people? > how long? > how many times?
- It is required to keep attention of many people to the signage as long time as possible.

The images show examples of digital signage: a large outdoor display, a tall building display, and a display with multiple screens.

### Waving-hand steganography

We aim to propose a new way of displaying information or messages so that watching digital signage will not only receive information but will become an **enjoyable** experience to viewers.

### Principle of hand-waving steganography

1. A positive image (Image 1) and its negative image (Image 2) are switched rapidly.
2. Luminance addition (Image 3) is perceived when the screen is viewed directly.
3. Partially decoded information (Image 4) is perceived when the screen is viewed through a waving hand.

### Results of hand-waving steganography

Input image

Direct viewing

Viewing through a waving hand

### Aerial display

**Aerial 3D display provides a new world for digital signage.**

#### Advantages:

- High sense of reality
- No physical contact
- Precise position

### Prior developments on floating/aerial display

Floating display enables direct touch inputs for 3D interaction and

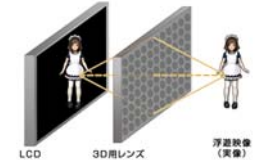

Volumetric 3D display of CT data for medical and real objects for ads.

Imaging with mirror array

### Challenges for Aerial LED signage

In order to install LED signage for the general public,

- Directivity: wide viewing angle
- Readability: smooth lines
- Robustness: safety issues
- Scalability: large size are required.

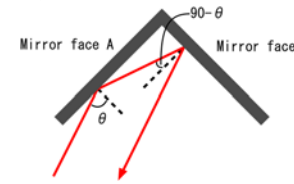

### Image forming by use of dihedral corner reflectors

Incident ray to Mirror A at  $\theta$  degrees and reflects at  $2\theta$  degrees.

Then, incident to Mirror B at  $90 - \theta$  degrees and reflects at  $180 - 2\theta$  degrees.

- Total change of direction:  $2\theta + 180 - 2\theta = 180^\circ$
- Every outgoing ray is directed to the reverse direction of the incident ray.

### Image forming by use of dihedral corner reflectors

### Experimental setups

- Reflected light distributions were investigated by changing the incident angle ( $\theta = 15^\circ, 30^\circ, 45^\circ$ )
- Observation of differences in converged lights by thickness of CMA.
- The light source is located at 50 cm apart from the CMA

### Observations under changing the incident angle

- Stainless steel mirror (Thickness 8mm)
- Screen distance 30cm
- A : transmitted light
- B, C : single reflected light
- D : double reflected light (converges)

### Observation of the imaging position by moving the screen

## Warm Signage

- People can walk through the aerial signs.
- Walkers feel warmth of the signs with their skins.
- 3D Signs for blind people can be realized.

## Observation of thermal image with thermo-chromic screen

## Purpose of AIRR (aerial imaging by retro-reflection)

To realize a new aerial 3D LED display that overcomes the three problems.

1. Stray lights

→ No stray light

2. Alignment problems

→ No precise tiling

3. Noticeable overlaying pattern

→ No mesh

We utilize retroreflective sheeting for aerial display.

## Application of retroreflective devices

### Traffic signs

[http://www.kiwa-chemical.co.jp/film/reflection/capsule\\_prism/capsule\\_prism-index-j.html](http://www.kiwa-chemical.co.jp/film/reflection/capsule_prism/capsule_prism-index-j.html)

### Indicators

[http://www.kiwa-chemical.co.jp/film/reflection/capsule\\_lens/capsule\\_lens-index-j.html](http://www.kiwa-chemical.co.jp/film/reflection/capsule_lens/capsule_lens-index-j.html)

### Stereoscopic display

Hitachi  
Ohshima et al., SPIE 3012 (1997) 140.

### Full-parallax display

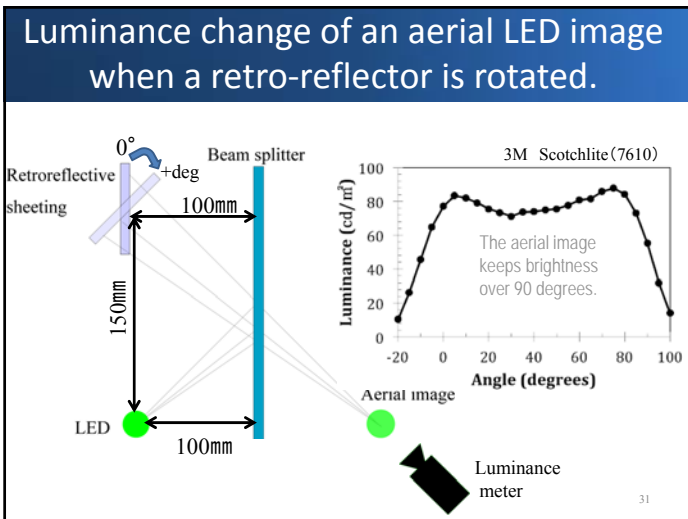

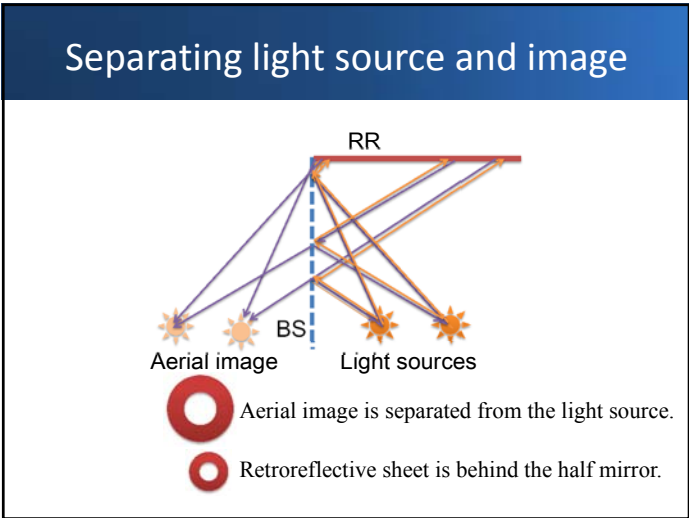

Keio Univ.  
Yoshida et al., J. ITE 66 (2012) 1.

### Optical camouflage

<http://tachilab.org/>

Composition of retroreflective sheeting		
	Corner-cube type	Micro-beads type
Structure		
Advantages	Precise reflected angle High reflectance	Wide viewing angle Freedom in shape Flexible
Problems	Narrow viewing angle Only flat shape Thermal stability	Not precise reflected angle A little scattering

### Aerial image size linearly increases with floating distance.

Experimental results on aerial-image size by AIRR (aerial imaging by retro-reflection) suggest that prism type forms a fine aerial image rather than micro-beads type.

◆	A	Enclosed type of micro-beads (black)
□	B	Exposed type of micro-beads (white)
◇	C	Enclosed type of micro-beads (white)
△	D	Prism type

### Demonstration of aerial LED screen

We have utilized a full-color LED panel for an aerial screen.

- |                                      |                                     |
|--------------------------------------|-------------------------------------|
| 1. Color: 24-bit full color          | 1. Number of pixels: 40 × 40 pixels |
| 2. Pixel pitch : 6mm                 | 2. Floating distance: 50 cm         |
| 3. Luminance: 2000 cd/m <sup>2</sup> | 3. Visible under room lighting      |

### AIRR Tablet: configuration

System Overview

“AIRR Tablet” on YouTube <http://youtu.be/iJd7fpH8n6M>

### Applications of optical frequency comb for information photonics

#### Frequency domain: ultimately precise ruler

1. Sub-million coherent lasers with very narrow bandwidth
2. We propose IP applications by mapping frequency into space.

#### Temporal domain: ultra short pulses

1. Limited coherence length -> OCT, interferometry, DH by Dr. Dahi
2. Multi-photon absorption, ultimately high-speed imaging

### Mapping of frequency into space

Spatial information is encoded in spectrum.

Every frequency is modulated by the corresponding spatial information.

Output light

Input light

2D grating

Object

Frequency is mapped to spatial direction. (Reverse mapping is also possible.)

**OFC enables digitizing space.**

1. Discrete spectrum prevents crosstalk between pixels.
2. Frequency sweeping of OFC fills between pixels and enables superresolution.
3. Dual combs spectroscopy detects information of each pixel separately.

<http://www.opticsinfobase.org/abstract.cfm?URI=UP-2006-WA3>

### Application of optical frequency comb for one-shot full-field confocal

Collimator lens

Mechanical scanning devices

Photo detector

2D grating

Confocal pinhole

Beam splitter

Microscope objective

Exit pupil of objective

Scanning

Detection

Focused beam spots are generated by single shot of OFC pulse.

*Mr. Hase and Mr. Miyamoto succeeded in getting images.*

### Application of OFC to digital holography

#### Scanless "optical scanning holography"

Optical scanning holography enables us to obtain hologram by use of a single pixel detector.

Dual combs spectroscopy detects all frequency components.

OFC enables one-shot 3D image detection at a very high frame rate.

2D grating maps frequency to 2D directions.

Fig. 1. Optical Scanning Holography (M's, mirrors; AOM1,2, acousto-optic modulators; BS1,2,3 beam splitters; BE1,2, beam expanders; L, focusing lens; x, electronic multiplexer; LPF, low pass filter).

Y. S. Kim, et al., Opt. Exp., Vol. 21, 8183 (2013).

### Application of OFC to compressive sensing

#### One-shot imaging from scattered lights

Ultra Fast LASER

Beam Splitters

Photo-Detector

Streak Camera

Galvo

Object (Hidden)

Occluder

Recovering three-dimensional shape around a corner using ultrafast time-of-flight imaging

Pre-calibrations: knowledge of scattered pattern for each modes by ghost imaging etc. (This may be a practically time-consuming problem.)

Imaging through a multi-mode optical fiber is also possible without lens nor imager.

Mapping of frequency to direction and dual-combs spectroscopy perform the above technique by one-shot of OFC.
